The SYNTHOPHONE is an actual alto saxophone that has been "enhanced" with internal electronics to send MIDI data to synthesizers and computers.

The instrument feels and plays like a real saxophone. It is also capable of producing some amazing effects.

"The real-time flexibility of Synthophone harmony is unmatched in any other harmonizer ever created." - robotax

The MIDI format of the SYNTHOPHONE allows you to choose from a large selection of synthesizers. Play into sequencers and even use notation programs that will turn your music into written parts.

With "special fingerings" it is possible to leave your synthesizers backstage, since you can select your sounds and their ideal performance parameters directly from the instrument.
